

Reduce Labor Time and Make a Better Impression on Visitors With Quick Maintenance Restroom Systems

In the restroom maintenance business, one of the best ways to cut costs and increase profits is to reduce time spent on maintenance.

One way to do this is by purchasing restroom products and systems that deliver products more efficiently and eliminate waste and clutter. To help make your restroom a quick maintenance restroom, consider this checklist of products and systems:

Quick Maintenance Restroom Checklist

- High-capacity roll towel systems
- High-capacity bath tissue dispensers with individual sheets of bath tissue
- Coreless bath tissue systems
- Jumbo roll bath tissue systems
- Disposable, self-contained soap systems
- High-quality concentrated soap

Roll Towels

High-capacity roll towel systems can help reduce dispensing problems and the associated waste and litter of folded hand towels. Roll towel systems offer controlled dispensing and cut down dramatically on waste and consumption. They also last longer, which means less time spent refilling. Today there is a longer-lasting 1,000-ft. roll towel, which, through a new technology, offers 25 percent more feet on a single roll than the popular 800-ft. towel without

increasing roll diameter. Because it provides more towel product on a single roll, it can help reduce supply run-out and cut maintenance time as a result. With more feet per roll, this towel increases available storage space too.

Folded Towels

If your facility is already set up for folded towels, the best system from a quick maintenance perspective is one that offers controlled dispensing. Consider two-ply towels that dispense one towel at a time. The use of these towels can save money and labor time refilling dispensers.

Bathroom Tissue

Again, controlled dispensing is the key. Consider installing a quick maintenance, cost-effective product that provides individual, high-quality two-ply bathroom tissue sheets in an attractive high-capacity dispenser. These systems can hold the equivalent of up to five standard bathroom tissue rolls. This type of system also requires less maintenance time and fewer trips to service the dispenser.

Another option is coreless bath tissue with the center hole filled in with bath tissue. It provides double the number of sheets as standard bath tissue with the same pleasing appearance. With greater capacity on a roll, coreless tissue lasts longer, saving maintenance time with less frequent run-outs. In addition, there are no cores to throw away.

For very heavily trafficked areas, a jumbo roll system provides high capacity and can reduce maintenance time refilling dispensers.

Skin Care Systems

Your best bet from a quick maintenance perspective is a disposable, self-contained soap system that includes the dispenser and soap in one unit. As soap is depleted, maintenance professionals simply discard the unit and install a new one. These dispensers are recyclable, and an entire changeout takes only seconds.

These types of units install simply into easy-to-mount brackets. They offer the appearance of permanent wall-mounted dispensers and provide easy and reliable dispensing without leaking, clogging or dripping soap.

In addition, these systems offer high levels of soap evacuation so less is wasted versus bag in box soap products. Both windows and empty lines also help the maintenance staff see when it's time to change the units. This not only minimizes soap waste, but improves cost-in-use and reduces labor time.

Skin Cleansers

To reduce maintenance time with skin cleansers, use thicker, high-quality concentrated soap. It can last longer than conventional soap, reducing maintenance time as a result.

Remember, quick maintenance solutions not only improve the functionality of the restroom but make your cleaning time less involved so you can spend your time maintaining other areas of your facility.
